1 Access to the application.....	2
----------------------------------	---

1. Access to the application

Due to its nature, Click-Unit can constitute a security problem. Click-Unit essentially serves as a sort of proxy forwarding http requests to any web server and returning the response to any client.

Obviously running Click-Unit on a publically accesable URL is a major security issues. Steps should be taken to avoid that Click-Unit should be used as a public "proxy".

Warning:

It's strongly recommended that all access to the Click-Unit only be allowed from localhost. This can be done with the use of a firewall or via the configuration of the web container.
